

## Fork Positioner for Forklift

Forklift Fork Positioners - A fork positioner is an apparatus made out of high quality materials meant to endure the most demanding operations and work environments. This piece of equipment can enable the person driving to be able to control the forks hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the arms or the entire load in order to facilitate much more exact lifting and position in a quicker and much more effective manner.

The unique blade pocket design can enable the person operating it to be able to safely sway the unit's forks without any worry of destroying the positioning cylinders. This could allow the worker the option to either perform independent or simultaneous blade movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into blade positioners on available units.
